1

The adhesive strength of tape can be influenced by various factors such as cleaning, the temperature during the application, the roughness of materials, and the contact surfaces of the adhesive with materials. For optimal and secure adhesion, surfaces must be clean, dry, compact, and at room temperature.

Notice: Never use ethyl alcohol and cleaning products containing silicones as they lessen the effectiveness of the adhesion.

To clean surfaces with generic contaminants such as dust, dirt, and surface residues, use a 50/50 solution of isopropyl alcohol and water. Wipe the surface right before applying the tape, even if it has been cleaned previously. Ensure the surfaces are dry before applying the tape.

Apply tape on flat surfaces only, avoiding grout and sealant lines in tile.
